

# Commercial Renewable Energy

**Clients: Various**

**Locations: Throughout Ontario**

**Services: Development Approvals for Commercial Renewable Energy systems**

The market for alternative energy systems, particularly those serving the commercial sector, is creating opportunities for those firms on the leading edge of alternative energy planning. Major commercial investors, owner-users and national tenants, have a growing interest in adding value to real estate holdings and reducing operational costs.

Building on our municipal renewable energy policy experience, the Jones Consulting Group Ltd. has been active within the commercial sector, initiating consultations with existing clients to address their needs in reducing energy costs, capitalizing on rising energy prices, and adding value to real estate by utilizing our expertise in solar and wind energy projects.

We have initiated early discussions with a major retailer in Ontario, to provide services for the development approval of renewable energy systems on their stores, as well as to market renewable energy systems to their customers.

Our affiliations with other commercial clients is intended to build on relationships already established with developers of large and small-scale wind projects and solar energy development projects that currently form an important part of our business.

The direct involvement with the establishment of a large-scale solar farm in Simcoe County (one of the largest in Canada) makes us well qualified to coordinate the approval process and establishment of other renewable energy projects, large or small.
